Bracknell, Berkshire, United Kingdom

Summary

First-Class MComp Computer Science graduate specialising in gameplay programming, with experience developing C++ gameplay, physics, animation and audio systems. Combines game-design awareness with technical problem-solving, extending core mechanics into new features. Strong collaboration skills, leading to successful team projects. Confident working across gameplay and engine code, and quickly adapts to unfamiliar frameworks to produce robust code.

Projects

Graph-Based Real-Time Destruction - MComp Dissertation
Unreal Engine 5, C++, Chaos Physics | 2026 | GitHub | Video

- Designed and built a playable demolition prototype comparing physics constraint, graph connectivity and load-propagation models to structural destruction.
- Implemented runtime graph construction, breadth-first support analysis, distance-based explosive damage and cascading structural failures.
- Developed repeatable benchmark scenarios and CSV data collection to compare setup cost, solve time, frame time and behavioural correctness across the three models.

Push-Pull - Gameplay and Engine Programmer, Team Project
C++, Jolt Physics, FMOD | 2026 | Video

- Expanded the core push-pull mechanic with original traversal and environmental-puzzle features: a self-returning interactive platform that players could reposition and ride, and movable objects used to bridge pitfalls.
- Integrated Jolt Physics and rebuilt player movement and push-pull interactions around forces and distance constraints, enabling object manipulation and anchor-based swinging.
- Developed camera-aware target selection and lock-on using view-centre weighting and raycast visibility checks.
- Implemented a state-driven animation controller with keyframe sampling, quaternion interpolation and blended transitions between movement states.

Work Experience

Develop at Ubisoft - Programming Mentee **Nov 2023 - Mar 2024**

- Developed a C++ 3D game prototype by applying projection and viewing pipeline techniques within an API originally designed for 2D graphics.
- Improved runtime object management by removing off-screen entities and investigated back-face culling as a rendering optimisation.
- Received regular technical and design feedback from a senior Ubisoft developer.

Online Tutor - MyTutor **Apr 2022 - Present**

- Delivered more than 1,000 lessons in programming, computer science and mathematics, adapting technical explanations to students of differing abilities.
- Guided students through algorithm design, debugging and optimisation while managing a substantial workload as a full-time university student.

Education

Newcastle University **2022 - 2026**
MComp Computer Science (Game Engineering)
First-Class Honours

Strode's College **2019 - 2021**
A-Levels
Mathematics (A*), Further Mathematics (A), Computer Science (A*),
Music Technology (A)

Technical Skills

Programming Languages
C++, C#, Python, Java, SQL

Engines and Libraries
Unreal Engine 5, Unity, Jolt Physics, FMOD

Gameplay and Systems
Player input, physics interactions, collision queries, skeletal animation, state machines, graph traversal, pathfinding

Development Tools
Git, GitHub, Visual Studio, Docker, PostgreSQL
